

Bilaga till rapport

Risk- och behovsbedömning av ungdomar
avseende återfall i våld och annan kriminalitet,
SBU-rapport nr 303/2019

Bilaga 1 Tabeller med beskrivning av de ingående studierna

Appendix/Bilaga 1a Youth Level of Service/Case Management
Inventory (YLS/CMI)

Appendix/Bilaga 1b Studies on Structured Assessment of
Violence Risk in Youth (SAVRY)

Appendix/Bilaga 1c Other methods

Appendix/Bilaga 1d Unstructured clinical assessment

Appendix/Bilaga 1e Qualitative studies

References/Referenser

Appendix/Bilaga 1a Studies on YLS/CMI.

Appendix/Bilaga 1e Qualitative studies.

First author Year Country	Aim and method	Population Setting	Results (themes)
<p>Guy et al 2014 [42] USA Moderate risk of Bias</p>	<p>This study investigates JPOs' expectations of and experiences using the YLS/CMI and SAVRY for case planning with probationers.</p> <p>First, we examined JPOs' broad perceptions about the usefulness and difficulties of the instruments. Next, we investigated JPOs' experiences using the instruments with respect to (1) rating specific items and (2) making overall ratings about risk level. Third, among SAVRY users only, we investigated the degree to which JPOs reported rating the items and making a SRR in a manner consistent with the SPJ model's concepts of manifestation, relevance, and linearity.</p>	<p>Six probation offices</p> <p>71 Juvenile probation officers, JPOs, across the six probation offices.</p> <p>JPOs on average were 35.49 (sd 9.7) years old, men (52.1%, n=37), and Caucasian (63.2%, n=43; African American: 33.8%, n=23; Other: 2.9%, n=2), data were missing for three JPOs). Most had a bachelor's degree (75.8%, n=50) and a few had a master's degree (24.2%, n=16; data were missing for five JPOs).</p> <p>YLS/CMI users had significantly more years of experience working with juvenile justice-involved youth (mean=14.3, sd =10.0) than SAVRY users (mean=9.72, sd =.15); t (130) 2.74, p .007; d.48).</p>	<p>Overall, the majority of users of both instruments perceived them to be 'somewhat' or 'very' helpful</p> <p>for making recommendations about disposition, services, and level of supervision across both follow-up periods.</p> <p>Perceived Helpfulness of the Risk Instruments</p> <p>YLS/CMI:</p> <p>The most frequently identified theme was use of the instrument to "back up" their opinions about risk level and recommendations regarding services</p> <p>and level of supervision, which they believed they would have reached using only their professional experience.</p> <p>In some cases, YLS/CMI results were valued only if they supported the JPO's opinion.</p> <p>Other, less frequently, identified themes related to the perceived helpfulness of the instrument included more comprehensive gathering of risk-related information, the "user friendly" aspects associated with having the YLS/CMI items and scoring guidelines incorporated into an electronic data management system, and the consistency across</p>

First author Year Country	Aim and method	Population Setting	Results (themes)
	<p>Eight trained researchers interviewed JPOs three times about their case management practices and experiences</p> <p>supervising probationers: prior to implementation of and training on the risk assessment instrument, three months after implementation, and 10 months after implementation.</p> <p>Only data from the two post-implementation interviews are reported here, and subsequently are referred to as the first and second interviews, respectively. JPOs were queried regarding how challenging it was to make the SRR (for SAVRY users) or the final risk estimate that could lead to a</p> <p>professional override (for YLS/CMI users). They also were asked to describe any factors they believed could make that process easier. In the</p>		<p>probation offices for assessing risk for reoffending using the same criteria.</p> <p>SAVRY:</p> <ul style="list-style-type: none"> - Emphasis on professional judgment (as a positive). - Enhanced data collection. - Increased knowledge about risk factors. <p>Other minor themes observed related to positive aspects of SAVRY included the promotion of objectivity and</p> <p>transparency in the risk assessment process, having a research based procedure “back up” their professional opinion and recommendations, the utility of SAVRY for tracking changes in risk over time, ease of communication between professionals trained in the same instrument (e.g., speaking the “same language”), and increased ability to “pinpoint” the most critical criminogenic needs to be targeted for treatment.</p> <p>Perceived Difficulties of the Instruments</p> <p>Amongst both YLS/CMI and SAVRY users, the most frequently reported disadvantage was the increased length of time required to complete the pre-dispositional report (into which the instruments’ ‘results’ were incorporated).</p> <p><i>YLS/CMI users.</i> Many JPOs cited the redundancy between the information gathering and decision-making practices they were using</p>

First author Year Country	Aim and method	Population Setting	Results (themes)
	<p>final interview, SAVRY users were queried regarding the ways in which they used the instrument within the framework of the SPJ model. They were asked to describe the process they followed when making the SRR and to answer specific (and face valid) questions to assess –in a rudimentary manner –the degree to which they understood assessment practices consistent with the SPJ model.</p> <p>Most interviews were conducted over the phone (some in person) and all were audiotaped and transcribed. Qualitative data were coded using a content analysis approach through the use of verbatim interview transcripts to uncover common themes. The content analysis comprised several steps. First, two researchers read 10 randomly</p>		<p>prior to YLS/CMI implementation and the practices put into place with the YLS/CMI.</p> <p><i>SAVRY users.</i> The majority of SAVRY users expressed a preference for an instrument that incorporated professional judgement, but a few expressed an inclination toward using an instrument that assigned a risk level automatically. For a minority of SAVRY users, this preference was rooted in their desire to have a more structured instrument that provided immunity against negative outcomes. Other SAVRY users voiced concern that individual differences in JPOs' attitudes, orientation towards retribution, or tolerance for risk taking could affect the way in which the SRR is assigned.</p> <p>Some SAVRY users expressed a desire to reduce the perceived subjectivity associated with assigning the SRR. An unexpected finding that emerged suggested concern about misusing the flexibility of the SPJ approach to avoid additional work (because supervision requirements were tied to risk level by policy). A few JPOs indicated SAVRY would be more helpful to less experienced JPOs.</p> <p>Experiences Rating Instruments' Items</p> <p><i>YLS/CMI-users</i> Few JPOs reported finding specific items difficult to rate at the second interview (nine of 25, 36%). Some responses suggested frustration with the dichotomous item ratings.</p> <p><i>SAVRY users.</i> At the second interview, 25 of 44 JPOs (57%) reported finding one or more items difficult to rate.</p>

First author Year Country	Aim and method	Population Setting	Results (themes)
	<p>selected transcripts of interviews with SAVRY users and developed a set of initial themes. Following this initial step, 35 themes were generated that reflected a detailed breakdown of JPOs' satisfaction with and use of SAVRY in the field. Next, a more parsimonious set of second order themes was developed (comprising 19 themes).</p>		<p>Experiences Making Overall Risk Ratings</p> <p><i>YLS/CMI users</i> Approximately one quarter of YLS/CMI users (8 of 28, 29%) reported having never applied a professional override, despite having wanted to do so. Of those who had, most found making the override to be relatively easy.</p> <p><i>SAVRY-users</i> Among the minority of JPOs who described the process of selecting the SRR as being difficult at the first interview</p> <p><i>Process for generating the SRR</i></p> <p>Post-hoc Themes Identified</p> <p><i>YLS/CMI users.</i> The most prevalent theme was frustration associated with lack of buy-in from judges and attorneys, and the consequent lack of impact on case planning and risk management activities.</p> <p><i>SAVRY users.</i> A theme emerged related to need for training in interviewing skills. Many JPOs indicated they used the semi-structured interview guide as an inflexible series of questions, all of which had to be asked. Several JPOs expressed frustration, which they attributed toward SAVRY, that the information obtained from separate interviews with the youth and parent at times was discrepant. Some JPOs expressed concern that more time was devoted to the assessment process at the expense of time supervising youth in the field. Other SAVRY users suggested that risk assessment procedures could be improved by the creation of an intake unit.</p>

First author Year Country	Aim and method	Population Setting	Results (themes)
Vincent et al 2012 [43] USA Importance of Implementation Moderate risk of Bias	<p>To examine (a) attitudes toward rehabilitation,</p> <p>(b) perceptions of the likelihood of youth reoffending, and</p> <p>(c) the factors considered in case management decisions.</p> <p>JPOs were also asked about the anticipated benefits and barriers to implementation of a tool, and subsequently asked about the actual benefits and barriers after they had been using the tool in their day-to-day practice.</p> <p>A mixed-methods approach was used to code the qualitative data obtained from these interviews. There were four steps.</p>	<p>Eighty-eight JPOs and 23 administrators (<i>N</i> = 111) completed at least one of three waves of interviews. Self-report questionnaires were administered.</p> <p>Every administrator and JPO at each site were interviewed at least once. The sample was 53.2% boys, 66.7% White and 31.4% African American, and averaged 38.91 years of age (<i>sd</i> = 10.67). Most participants had a bachelor's degree (74.5%) and 24.5% had a master's degree. The median years of experience working with JJ-involved youth was nine (<i>sd</i> = 10 years).</p> <p>An additional 13 JPOs were located in a NE unit that had not yet implemented the RNA tool (NE Control), and therefore served as controls, making a total of 126 participants. Controls did not differ from other participants on basic demographic characteristics.</p>	<p>Benefits of Risk Assessment</p> <p>During pre-implementation interviews, these questions were phrased as anticipated benefits or barriers because JPOs had not yet been exposed to SAVRY or YLS/CMI.</p> <p>For benefits, the most common themes were guiding the JPOs in various areas of decision-making; these did not change much over time. Some unanticipated benefits JPOs mentioned were availability of the interview guides and feeling that the tool enhanced their credibility.</p> <p>Barriers to Use of Risk Assessment</p> <p>With respect to barriers, most issues participants anticipated prior to implementation were not identified as barriers once JPOs began using the tools. For example, resistance to change and feeling devalued by the tool were responses that both decreased in frequency. The most commonly reported barrier, however, was the amount of time it took to complete the assessments, and this remained high over time. Judge or attorney buy-in (significantly more common in NE) and finding the tools hard to rate (significantly more common in S) were frequently identified barriers that participants did not anticipate initially.</p> <p>Some quantitative data</p> <p>After asking nonleading, open-ended questions about decision-making, JPOs were asked directly if they used SAVRY or YLS/CMI in these decisions.</p>

First author Year Country	Aim and method	Population Setting	Results (themes)
			JPOs were significantly more likely to report using RNA tools for all three types of decisions. Specifically, reported use of RNA tools increased from 27.7% to 77.2% (0.59) for disposition recommendations, from 23.5% to 80.4% (0.62) for service referrals, and from 52.8% to 90.2% (0.66) for use in supervision levels. Each difference was statistically significant at the p .01 level and represented large effect sizes.

JPOs = The Division's Juvenile Probation Officers; **SPJ** = structured professional judgement

Risk- och behovsbedömning av ungdomar
avseende återfall i våld och annan kriminalitet

Bilaga 8 CASP Qualitative Checklist

Risk- och behovsbedömning av ungdomar avseende återfall i våld och annan kriminalitet

CASP Checklist: 10 questions to help you make sense of a **Qualitative** research

How to use this appraisal tool: Three broad issues need to be considered when appraising a qualitative study:

-  Are the results of the study valid? (Section A)
-  What are the results? (Section B)
-  Will the results help locally? (Section C)

The 10 questions on the following pages are designed to help you think about these issues systematically. The first two questions are screening questions and can be answered quickly. If the answer to both is “yes”, it is worth proceeding with the remaining questions. There is some degree of overlap between the questions, you are asked to record a “yes”, “no” or “can’t tell” to most of the questions. A number of italicised prompts are given after each question. These are designed to remind you why the question is important. Record your reasons for your answers in the spaces provided.

About: These checklists were designed to be used as educational pedagogic tools, as part of a workshop setting, therefore we do not suggest a scoring system. The core CASP checklists (randomised controlled trial & systematic review) were based on JAMA 'Users' guides to the medical literature 1994 (adapted from Guyatt GH, Sackett DL, and Cook DJ), and piloted with health care practitioners.

For each new checklist, a group of experts were assembled to develop and pilot the checklist and the workshop format with which it would be used. Over the years overall adjustments have been made to the format, but a recent survey of checklist users reiterated that the basic format continues to be useful and appropriate.

Referencing: we recommend using the Harvard style citation, i.e.: *Critical Appraisal Skills Programme (2018). CASP (insert name of checklist i.e. Qualitative) Checklist. [online] Available at: URL. Accessed: Date Accessed.*

Paper for appraisal and reference:

Section A: Are the results valid?

1. Was there a clear statement of the aims of the research?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

- HINT: Consider
- what was the goal of the research
 - why it was thought important
 - its relevance

Comments:

2. Is a qualitative methodology appropriate?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

- HINT: Consider
- If the research seeks to interpret or illuminate the actions and/or subjective experiences of research participants
 - Is qualitative research the right methodology for addressing the research goal

Comments:

Is it worth continuing?

3. Was the research design appropriate to address the aims of the research?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

- HINT: Consider
- if the researcher has justified the research design (e.g. have they discussed how they decided which method to use)

Comments:

4. Was the recruitment strategy appropriate to the aims of the research?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

HINT: Consider

- If the researcher has explained how the participants were selected
- If they explained why the participants they selected were the most appropriate to provide access to the type of knowledge sought by the study
- If there are any discussions around recruitment (e.g. why some people chose not to take part)

Comments:

5. Was the data collected in a way that addressed the research issue?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

HINT: Consider

- If the setting for the data collection was justified
- If it is clear how data were collected (e.g. focus group, semi-structured interview etc.)
- If the researcher has justified the methods chosen
- If the researcher has made the methods explicit (e.g. for interview method, is there an indication of how interviews are conducted, or did they use a topic guide)
- If methods were modified during the study. If so, has the researcher explained how and why
- If the form of data is clear (e.g. tape recordings, video material, notes etc.)
 - If the researcher has discussed saturation of data

Comments:

6. Has the relationship between researcher and participants been adequately considered?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

HINT: Consider

- If the researcher critically examined their own role, potential bias and influence during (a) formulation of the research questions (b) data collection, including sample recruitment and choice of location
- How the researcher responded to events during the study and whether they considered the implications of any changes in the research design

Comments:

Section B: What are the results?

7. Have ethical issues been taken into consideration?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

HINT: Consider

- If there are sufficient details of how the research was explained to participants for the reader to assess whether ethical standards were maintained
- If the researcher has discussed issues raised by the study (e.g. issues around informed consent or confidentiality or how they have handled the effects of the study on the participants during and after the study)
- If approval has been sought from the ethics committee

Comments:

8. Was the data analysis sufficiently rigorous?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

HINT: Consider

- If there is an in-depth description of the analysis process
- If thematic analysis is used. If so, is it clear how the categories/themes were derived from the data
- Whether the researcher explains how the data presented were selected from the original sample to demonstrate the analysis process
- If sufficient data are presented to support the findings
 - To what extent contradictory data are taken into account
- Whether the researcher critically examined their own role, potential bias and influence during analysis and selection of data for presentation

Comments:

9. Is there a clear statement of findings?

Yes	<input type="checkbox"/>
Can't Tell	<input type="checkbox"/>
No	<input type="checkbox"/>

HINT: Consider whether

- If the findings are explicit
- If there is adequate discussion of the evidence both for and against the researcher's arguments
- If the researcher has discussed the credibility of their findings (e.g. triangulation, respondent validation, more than one analyst)
- If the findings are discussed in relation to the original research question

Comments:

Section C: Will the results help locally?

10. How valuable is the research?

HINT: Consider

- If the researcher discusses the contribution the study makes to existing knowledge or understanding (e.g. do they consider the findings in relation to current practice or policy, or relevant research-based literature
- If they identify new areas where research is necessary
- If the researchers have discussed whether or how the findings can be transferred to other populations or considered other ways the research may be used

Comments:
